

Lead card — functional & visual spec (v3)

Revision incorporating dev review: renamed section, defined +X precisely, added sort tie-breakers, expanded Last Activity, made quick-action behavior an explicit contract, added accessibility requirements, reconsidered the owner avatar, clarified dynamic field sourcing, and restated compactness as a hard constraint.

1. Naming — "Activity Summary" (not "Priority Box")

Renamed from the previous "Priority Box." **"Priority" was ambiguous** — many CRMs separately track lead priority (High / Medium / Low), and reusing that word here risked implementers wiring the wrong field to it. This section has nothing to do with lead priority — it always shows a single **activity**, so the name says exactly that.

Use "Activity Summary" in code, tickets, and UI copy. ("Upcoming Activity" was considered and rejected — this section must also show broken/overdue items, not just upcoming ones, so that name would mislead on a red card.)

2. Card anatomy

JD

1

Lead name + status.

Name fixed, always visible, bold. Status is plain text underneath — the only place pipeline stage appears. No card-wide color tinting by stage.

2

Owner avatar — now optional

reconsidered

. See §3 — admin-configurable, off by default, no permanent caption label.

3

Dynamic fields.

Sourced from the Lead Details record only (§4) — never arbitrary values. Capped at 3-4.

4

Activity Summary.

One item, chosen by the algorithm in §5, including defined tie-breakers and an exact definition of "+X".

5

Last Activity.

Historical only — expanded event list and rules in §6.

6

Quick actions.

Fixed 7, explicit behavior contract in §7.

3. Header — Lead Name + Owner avatar (reconsidered)

The original design showed a permanent owner avatar with an "owner" caption label on every card, top-right. On review, this is being changed:

- **Owner display becomes an admin-configurable toggle, off by default** — the same pattern as Dynamic Info Area fields (§4). Most Kanban-style lead boards prioritize customer-facing information over internal ownership; showing it on every card by default spends space a customer detail could use instead.
- **If an org enables it**, show only a small (~18-20px) initials circle — **no permanent "owner" text label** underneath (that label cost a full extra line of vertical space for no functional gain, conflicting with the compactness principle in §9). Hover/tap reveals the full name via tooltip, same as everything else on the card.
- If a workflow genuinely depends on ownership being visible at a glance (round-robin routing, team-based boards), the org turns it on. It should not be assumed necessary for every deployment — this is a product decision per org, not a fixed design element.

4. Dynamic Information Area

Fields are sourced from the Lead Details record — standard or custom fields — never arbitrary or free-text values. The administrator can choose any Lead Detail field defined on the Lead object to display on the card. The card layout remains fixed; only the displayed field values change based on that selection.

Examples: Phone, Email, Company, Lead Source, Industry, Website, Lead Score, Pipeline/Stage, Tags, or any custom field. **Hard cap: 3-4 fields** displayed at once, regardless of how many the admin has access to select from. Values are live, reflecting the current lead record — never a cached snapshot. Never color-coded; color is reserved entirely for activity urgency (§5, §7).

5. Activity Summary — selection algorithm

Shows exactly one item: the single most severe activity across every type — scheduled (calls, appointments, tasks, follow-ups) and outstanding communications (missed calls, unreplied SMS, unreplied email).

```
1. Is anything broken? (overdue task/call/appointment, missed call, unreplied SMS/email past threshold)
   → yes: show the oldest / most severe broken item. Broken always outranks scheduled.
2. Nothing broken? Show the nearest-due scheduled item (soonest date/time first).
3. Nothing broken and nothing scheduled → hide the section entirely, card shortens. No placeholder, no gap (§11).
```

Tie-breaker rules new

When two or more activities share the exact same due date/time, resolve in this fixed order — every implementation must follow the same sequence:

1. Overdue before Due Today
2. Call
3. Meeting/Appointment
4. Task
5. Reminder
6. Oldest created date (earliest record creation timestamp wins)

"**+X**" — exact definition new

+X is the count of additional pending activities on the lead **that are not the one currently shown** in the Activity Summary — every other item that competed for the slot above but lost, still ranked by the same algorithm and tie-breakers. It is **not** a count of all activity ever logged on the lead.

- Clicking the Activity Summary row **or** the +X label opens the full activity list, pre-sorted with the identical priority algorithm — the expanded list's order must match the logic that chose the card's headline item.
- If there are zero additional items, +X is omitted entirely — never shown as "+0".

6. Last Activity — expanded new

Last Activity is historical, not pending work. It shows the most recent *completed* event only — never a due or upcoming item. Do not wire an overdue/pending item into this section.

Qualifying event types: Completed call · Sent SMS · Sent email · Completed meeting/appointment · Note added · Task completed · Status changed · Stage changed · Document uploaded · Document requested · Workflow completed · any other timeline event marked complete.

Rules:

- ✓ Always display the single most recent completed event across all types above.
- ✓ Always show relative time only (2h ago, Yesterday, 3 days ago) — never an absolute timestamp on the card face.
- ✓ Never use urgency colors — always neutral/muted text regardless of how old the event is. Does not participate in the red/amber/green system at all.
- ✓ Clicking it opens the full Timeline/Activity History.

7. Quick Actions — explicit behavior contract

new

Fixed set of 7, fixed order, always present: **Call • SMS • Email • Appointment • Task • Note • Attachment**. To remove ambiguity for implementation:

- ✓ Icons are always visible — never hidden or conditionally rendered. A type with nothing pending still shows its icon, just dimmed/neutral.
- ✓ Position never changes — same fixed order on every card regardless of data.
- ✓ Only badge count and color change per icon — nothing else about its rendering varies.
- ✓ Clicking an icon always performs its action (Call places a call, SMS opens a text composer, etc.) **regardless of its current color or badge**. Color/badge is a read-only status layer; it never gates or changes what the click does.

Icon	Reflects
Call	Nearest scheduled call, or missed calls if any exist (missed always wins)
SMS	Unreplied inbound texts
Email	Unreplied inbound email
Appointment	Nearest scheduled appointment
Task	Nearest scheduled or overdue task
Note	Always neutral — no due state
Attachment	Always neutral — no due state

Where	Color	Trigger	Badge shown when
Activity Summary	 Red	Overdue / missed / unreplied past threshold	Never — shows one item only
Activity Summary	 Amber	Due today, or received today	Never
Activity Summary	 Green	Scheduled in the future	Never
Quick action icon	 Red	Type has overdue/missed/unreplied item	Count of that type ≥ 2
Quick action icon	 Amber	Type is due today	Count of that type ≥ 2
Quick action icon	 Green	Type is scheduled in the future	Count of that type ≥ 2
Quick action icon	 Neutral	Nothing pending for that type	Never

Asymmetry to implement carefully: Call, SMS, and Email can never turn green — an unanswered message is never "upcoming." They're red (count ≥ 1) or neutral. Only Appointment and Task can show green.

8. Accessibility requirements

new

Color carries urgency meaning throughout this spec — it must never be the *only* signal.

- ✓ Never rely on color alone — every urgency state pairs with text ("Overdue 1 day" is text, not just a red background).
- ✓ Full activity titles available via tooltip/accessible text, not only through visual truncation (§10) — screen readers must reach the complete title.
- ✓ Keyboard accessible — Activity Summary row, +X, all 7 quick-action icons, and owner avatar (if enabled) reachable and operable via keyboard, with visible focus states.
- ✓ Screen reader friendly — icons carry accessible labels (e.g. `aria-label="Call – 2 missed"`), not just a decorative glyph.
- ✓ WCAG-compliant color contrast — every red/amber/green text-on-background pairing in §5 and §7 must meet WCAG AA at minimum.

new

10. The three activity states, with real card examples

Red — broken. Overdue, missed, or unreported
past threshold. Needs action now.

Not urgent yet — becomes red if ignored past
end of day.

Green — on track. Scheduled in the future,
nothing due yet.

11. Long titles

Full title: "Follow up on refinancing application before rate lock expires" — 58 characters.

Rule: truncate at ~30–40 characters, append "...". Full title always available via tooltip/accessible text (§8). Complete untruncated string is what's stored in the activity record — truncation is display-only. Same limit applies per-line inside the "+X" expanded list.

When a lead has nothing broken and nothing scheduled, the Activity Summary is removed from the layout entirely — the card gets shorter, never keeping the section's height as blank space. Confirmed bug in the first build reviewed (a lead with no upcoming task left a visible gap in the grid) — must not regress.

- Exact response-time threshold before an unreplied SMS/email counts as "broken" (proposed default: 24h).
- Whether missed-call/unreplied-message counts should trigger push notifications or escalation beyond the card.
- Whether the owner avatar (§3) ships default-on or default-off per org — needs a product decision, not just a dev default.
- Whether Note/Attachment icons should ever carry state beyond "neutral."
